Fabricate 1 metre of horizontal pipe and downturned elbow. Bolt to the existing elbow on one side and the tank top on the other, seal. (To match other pipes).

The flange is around 28cm in diameter, the same as the other pipes, as seen in this drawing.

If possible, can the pipe be rotated by about 60 degrees so that the downturned elbow is more central in the tank? We will be advised by you over the method.

This will give the visual appearance of the pipe entering the tank, and provide additional bracing to the vertical pipe

This pipe is hovering above the tank. For stability, can you please insert a spool and bolt onto the tank and seal.

The other two pipes you've already done, just needs some sealant around the join.
